Problem Statement: Gifting Sales & Operations Analysis

You have been given a transactional dataset from an online gifting platform that delivers gifts, flowers, cakes, and festive hampers for occasions such as Diwali, Raksha Bandhan, Holi, Valentine's Day, Birthdays, and Anniversaries. The dataset contains relational records across customers, products, and order transactions, including dates and transit times. Your task is to analyse this dataset using Excel to uncover key insights related to sales revenue, customer spending, logistics turnaround times, and product category performance.

Create an interactive dashboard and answer the following key business questions to help management understand sales trends, optimize fulfillment delivery, and improve overall customer satisfaction:

Total Revenue: Calculate the overall revenue generated across all completed orders in the dataset.

Total Order Volume: Determine the total number of orders placed across the entire platform.

Average Order Value (AOV): Evaluate the average amount spent per order to understand customer purchasing size.

Average Delivery Transit Time: Calculate the average number of days taken for gifts to be delivered to customers from the order date.

Monthly Order Trends & Spikes: Examine how order volumes and delivery transit days fluctuate across different months of the year.

Slowest Delivery Cities: Identify the cities with the highest average delivery transit days to uncover regional delivery bottlenecks.

Revenue & AOV by Occasion: Compare total sales and average basket spending across different festive and personal occasions.

Category Share by Value vs. Quantity: Analyse which product categories drive the highest share of revenue versus unit sales volume.

Customer Gender Distribution: Understand purchasing differences and order patterns across male and female customers.

Seasonal Operational Bottlenecks: Assess whether high-demand holiday spikes (such as Valentine's Day or Raksha Bandhan) cause noticeable delivery delays.
